

Apocalyptic Dates In The Future

Predicting the demise of the world has almost certainly been going on since man began thinking, whenever that was. It is warned about in Revelations in the Bible, so that must be about 2,000 years ago. However, it is the predictions of Nostradamus that are the most well-known and most copious. Some biographical accounts of Nostradamus' life assert that he was afraid of being victimized for heresy by the Inquisition, although neither prophecy nor astrology fell under their jurisdiction. He would have been in danger only if he had practiced magic to back up his predictions. In fact, his contact with the Church as a prophet and a healer were always very good. His short imprisonment at Marignane in late 1561 came about purely because he had published his 1562 Almanac without the prior permission of a bishop, contravening a recent royal decree. Here then are a couple of the prophecies of the ending of the world and the annihilation of mankind. December 21st, 22nd or 23rd 2012 are all possible dates for the ending of the world according to the ancient Mayan Calendar. 2012 has been determined by some to be the first possible date for the passing by of Planet X (Wormwood) and the demise of the world, as mentioned in Revelations, although this is hotly debated by Biblical experts and astronomers alike. 2012 is also the year given by Nostradamus as the possible demise. He gave three possible years for the apocalypse: 1994 and 1998 so this is his last opportunity to be correct. 2010 is the year so says the Hermetic Order of Golden Dawn. In 1143 St Malachy prophesied that there would be only another 112 more Popes. The current Pope Benedict is the 111th. He also predicted that the final Pope would be known as Peter of Rome, so we will have to wait and see for this one. 2017 is the year specified to the Sword of God Brotherhood by the Angel Gabriel. November 13th 2026 is the date according to a 1960 edition of 'Science' magazine. The author alleged that this would be the day that the planet's human population would 'reach infinity'. 2033 is held by many to be the 2000th anniversary of the crucifixion of Christ and a potential date for his return, which would indicate the demise of our Earthly period. 4,500,000,000 AD is the approximate date at which the Sun is expected to explode and in so doing, destroy the inner solar system including our Earth. Nobody knows, but unless we destroy ourselves first, this latter date is probably the most accurate and scientific date for the destruction of the planet.
